

## Radio station

The technical configuration of Radio 101 consists of two programme control rooms, one production control room and a service control room. The main programme control room is equipped with SOUNDCRAFT B400 sound console, TASCAM CD players and MD players/recorders, AKG microphones, DBX products for dynamic signal processing and other equipment needed for the realisation of a dynamic programme with a lot of contents and unexpected situations. The assisting control room is used for recording materials that are not in the running programme, but also for broadcasting when there is only one person who performs the jobs of an editor, a speaker and a technician. We have installed the SOUNDCRAFT SAC200 sound console, AKG microphones, and TASCAM CD and MD players/recorders. The production control room is equipped with the digital sound console TASCAM TM-D8000 with all accessory sources, recorders/players and SOUNDSCAPE digital multi-channel recording system. For the broadcasting programme made outside the radio station, the TELOS ZEPHYR XSTREAM ISDN codecs are used.
